## PROCESS FOR PREPARATION OF CEFDINIR TECHNICAL FIELD

The present invention relates to a process for preparing cefdinir  
5 represented by the following formula (I) as a cephalosporin antibiotics :

10

## BACKGROUND ART

15 Cefdinir of formula (I) above has a chemical name of 7β  
-[2-(2-aminothiazol-4-yl)-2-(Z)-(hydroxyimino)acetamido]-3-vinyl-3-cep-  
-hem-4-carboxylic acid. It is the third generation of cephalosporin  
antibiotics for oral administration and has a broader antibacterial  
spectrum over the general gram positive and gram negative bacteria than  
20 other antibiotics for oral administration. Particularly, it has been  
reported that cefdinir has an excellent antibacterial activity against  
Staphylococci and Streptococci.

25 In US Patent No. 4,559,334 is disclosed a process for preparing  
cefdinir as represented in the following reaction scheme 1.

30

35

## Reaction Scheme 1 :

25 In the above reaction, 7-amino-3-vinyl-3-cephem-4-carboxylic acid ester(A) is reacted with a reactive carboxylic acid derivative to obtain an 7-amido compound(B), and this compound is treated with a nitrosating agent to prepare an N-oxime compound(C). Continually, the compound(C) is cyclized with thiourea to prepare an aminothiazole compound(D), and then finally cefdinir of formula (I) is prepared by removing the carboxy protecting group.

30

35 In case cefdinir is prepared according to the reaction scheme 1, however, there can occur many problems such that the process for preparing the 7-amido compound(B) should be carried out at a

temperature below  $-20^{\circ}\text{C}$  under an anhydrous condition and that the isolation of the N-oxime compound(C) may cause a lot of troubles in the procedure of industrialization since the compound(C) is obtained as a solid having a syrup or a foam phase after the solvent is distilled off under reduced pressure. In addition, the aminothiazole compound(D) is obtained in a poor yield and purity and with a brownish poor color, which finally exerts a harmful influence upon the purity and color of the desired cefdinir. Further, in the reaction scheme 1, since cefdinir is synthesized through a complicated reaction consisting of 4 steps from the expensive 7-amino-3-vinyl-3-cephem-4-carboxylic acid derivative, the cost for production of cefdinir increases according as the whole reaction yield decreases.

### DISCLOSURE OF INVENTION

15

Thus, the present inventors have extensively studied to develop a novel process by which cefdinir can conveniently be prepared in a good yield and a high purity. As a result, we have identified that such a purpose can be achieved by using a novel cefdinir intermediate represented by the following formula (II) as a starting substance and then completed the present invention.

25

in which

30

Ph represents phenyl,  
p-TsOH represents p-toluenesulfonic acid, and  
DMAC represents N,N-dimethylacetamide.

Thus, it is an object of the present invention to provide a novel process for preparing cefdinir using the intermediate of formula (II) as a

starting substance.

It is another object of the present invention to provide a novel intermediate of formula (II), as defined above, and process for preparation thereof.

### BRIEF DESCRIPTION OF DRAWINGS

For a thorough understanding of the nature and objects of the invention, reference should be made to the following detailed description taken in connection with the accompanying drawings in which :

Figure 1 represents a X-ray powder diffraction spectrum of the compound of formula (II) ;

15

Figure 2 represents an IR spectrum of the compound of formula (II) ; and

Figure 3 represents a NMR spectrum of the compound of formula (II).

20

### BEST MODE FOR CARRYING OUT THE INVENTION

In one aspect, the present invention pertains to a process for preparing cefdinir of formula (I) characterized in that a trityl protecting group in the cefdinir intermediate of formula (II) is removed in the presence of an acid. The process is depicted in the following reaction scheme 2.

30

35

## Reaction Scheme 2 :

The most important feature in the process for preparing cefdinir according to the present invention is that the novel cefdinir intermediate of formula (II) which is very excellent in yield and purity is used as a starting material.

As the acid which can be used in the process for preparing cefdinir according to the present invention, an inorganic acid such as hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, Lewis acid, etc.; an organic acid such as acetic acid, formic acid, trifluoroacetic acid, methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, etc.; or an acidic hydrogen ion exchange resin can be mentioned, wherein Lewis acid includes boron trifluoride, boron trifluoride ethyletherate, aluminum chloride, antimony pentachloride, ferrous chloride, stannous chloride, titanium tetrachloride, zinc chloride, etc. When an organic acid such as trifluoroacetic acid or p-toluenesulfonic acid, or a Lewis acid is selected, it is preferable that the reaction is carried out in the presence of an anisole as a cation capturing agent. The acid is preferably used in an amount of 1 to 20 equivalents with respect to the starting material

(II).

It is preferable to carry out the reaction at a low temperature in a range of -30 to 5°C. But, the reaction can also be performed at 40 to 5 70°C in case of using the acid in an amount of 1 to 2 equivalents with respect to the cefdinir intermediate of formula (II).

As the solvent, one or more selected from a group consisting of water, ethanol, methanol, propanol, t-butanol, tetrahydrofuran, dioxane, 10 N,N-dimethylformamide, N,N-dimethylacetamide, methylene chloride and chloroform can be used, and if desired, the organic acid or inorganic acid itself can be used as a reaction solvent.

The cefdinir of formula (I) prepared according to the process as 15 explained above exhibits a superior quality in color, yield and purity to that prepared according to the earlier process, and such a result is basically caused by use of the cefdinir intermediate of formula (II) as a starting material. That is, this intermediate is a crystalline compound having a pale yellow color and a high purity more than 98%, therefore 20 it's good quality has a beneficial effect on the next step for finally producing cefdinir having an excellent quality.

Generally, the earlier process for preparing cefdinir from the reactive derivative has problems that 1-hydroxybenzotriazole or 25 2-mercaptobenzothiazole produced during the reaction can hardly be removed from the reaction mixture, which lowers the purity of the reaction product and also makes the purifying step difficult. Upon considering this, the present invention having no such problems can be estimated as an astounding one.

30

Furthermore, in the prior art, cefdinir can be prepared from the expensive compound(A) through a 4-step reaction. In contrast, in the present invention, only 2 steps of reaction are needed for the preparation of the final product, cefdinir. Therefore, a lot of beneficial effects can 35 be expected by applying the present invention for preparing cefdinir such

that a decrease of the yield due to the multi-step reaction can be prevented; the product can be provided with a low price since there is no need to use the expensive material; and the manufacturing time can be saved by cutting the reaction steps in half, and the like.

5

In another aspect, the present invention pertains to the compound of formula (II) above and process for preparing the same.

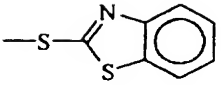

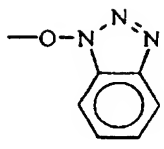

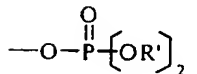

The cefdinir intermediate of formula (II) used as a starting material in the reaction scheme 2 is a crystalline complex with a salt and a solvent, and it can easily be prepared by reacting a reactive ester having the following formula (III) with a 3-cephem derivative having the following formula (IV) in a solvent in the presence or absence of a base and then by adding p-toluenesulfonic acid thereto. The reaction is depicted in the following reaction scheme 3 :

**Reaction Scheme 3 :**

in which

35

Z represents , , or  or

5

10

wherein R' represents C<sub>1</sub>-C<sub>4</sub> alkyl or phenyl, or R' together with phosphorus and oxygen atoms to which R' is attached can form a 5 to 6-membered heterocycle.

The reactive ester compound of formula (III) used as a starting substance in the reaction scheme 3 above is a known compound and can be prepared according to the process disclosed in literatures (see, European Patent Laid-open Publication No. 555,769; Japanese Patent Laid-open Publication No. sho 57-175,196). The 3-cephem derivative of formula (IV) can also be prepared easily according to the known method described in US Patent No. 4,423,213.

The reactive ester compound of formula (III) is used in an amount of 0.8 to 2.0 equivalents, preferably 1.0 to 1.2 equivalents with respect to the 3-cephem derivative of formula (IV). The solvent which can be used in the reaction of scheme 3 includes, N,N-dimethylacetamide alone, or a mixture of N,N-dimethylacetamide with one or more selected from a group consisting of ethanol, methanol, isopropanol, diethylether, tetrahydrofuran, dioxane, methylene chloride, chloroform, acetonitrile, ethyl acetate and acetone. In this case, the solvent is used in an amount of 10 to 60ml, preferably 10 to 30ml with respect to 1g of the 3-cephem derivative of formula (IV).

30

Generally, the reaction is carried out at a temperature of -15 to 40 °C, preferably 0 to 30°C. The reaction is completed after 1 to 24 hours have passed from the initial point, however, it is desirable to complete the reaction within 1 to 5 hours since the color of the reaction solution becomes poor and the amount of side products increases as the reaction

35

time becomes longer.

The process for preparing the compound (II) of the present invention can be carried out in the presence of a base. If a base is used, tertiary amines such as triethylamine, tri-n-butylamine, diisopropylethylamine, triethylenediamine, pyridine, N,N-dimethylaniline, etc., preferably triethylamine or tri-n-butylamine can be used as the base. The base can be used in an amount of 0.5 to 5 equivalents, preferably 1 to 2 equivalents with respect to the 3-cephem derivative of formula (IV). On the other hand, the reaction can also be carried out by using N-trimethylsilylacetamide or N,O-bis(trimethylsilyl)acetamide in an amount of 1 to 3 equivalents with respect to the 3-cephem derivative of formula (IV) instead of the base.

After the reaction is completed under the conditions as explained above, diethylether, diisopropylether or ethylacetate is added to the reaction mixture to crystallize the product in the work-up procedure. In this case, they are added in an amount of 2 to 6 times by volume with respect to the reaction solvent, however, it is desirable to add them in an amount of 3 to 5 times by volume considering the reaction yield and purity.

On the other hand, p-toluenesulfonic acid is usually used in an amount of 1 to 4 equivalents, preferably 2 to 3 equivalents with respect to the 3-cephem derivative of formula (IV).

The cefdinir intermediate of formula (II) thus produced is a crystalline complex with a salt and a solvent, and it has a unique structure wherein one molecule of p-toluenesulfonic acid and two molecules of N,N-dimethylacetamide are attached to the main structure. Accordingly, it can be isolated more easily from the reaction mixture in a high purity than the usual cephalosporin compound having a noncrystalline form.

It is recognized through a X-ray powder diffraction analysis that

the compound (II) has a different crystalline form from other noncrystalline compounds. Particularly, in the X-ray powder diffraction spectrum of Figure 1, the characteristic peak of the compound (II) is well represented. The unique Debye-Scherrer X-ray powder diffraction  
5 pattern of the crystalline compound of formula (II) is described in the following Table 1.

In Table 1 below, " $\theta$ " represents a diffraction angle, "d" represents a spacing between the layers, and " $I/I_0$ ," represents a relative  
10 intensity.

15

20

25

30

In addition, the structure of the intermediate (II) is identified qualitatively through IR and NMR spectroscopy (see, Figure 1 to 3)

Hereinafter, the present invention will be more specifically explained by the following examples. However, it should be understood that the following examples are intended to illustrate the present invention and not to limit the scope of the present invention in any manner.

EXAMPLE 1: Synthesis of 7 $\beta$ -[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxy-imino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid · p-toluene sulfonic acid · 2 N,N-dimethylacetamide

10

8.0g (35.4mmol) of 7-amino-3-vinyl-3-cephem-4-carboxylic acid and 21.5g (37.1mmol) of (Z)-(2-aminothiazol-4-yl)-2-trityloxyiminoacetic acid 2-benzothiazolyl thioester were suspended in 80ml of N,N-dimethylacetamide and 16.8ml (70.0mmol) of tri-n-butylamine was added thereto. Then, the reaction mixture was stirred for 1 hour while keeping the temperature at 15 to 20°C and 240ml of diethylether was added to the mixture. The reaction mixture thus prepared was stirred for 30 minutes and then filtered through a cellite. To the filtrate was added 20.2g (0.11mol) of p-toluenesulfonic acid · monohydrate dissolved in 40ml of methanol and the resulting solution was stirred for 2 hours at room temperature. After 160ml of diethylether was further added thereto, the whole solution was stirred for one hour at room temperature, cooled to 0 to 5°C, stirred for one hour and filtered. The crystal thus obtained was washed sequentially with 50ml of N,N-dimethylacetamide-diethylether(1:5, v/v) and 50ml of diethylether and then dried to obtain 32.3g (Yield 93%) of the title compound as a pale yellow crystal.

- HPLC Purity : 99.2%

35

EXAMPLE 2

10.0g (44.0mmol) of 7-amino-3-vinyl-3-cephem-4-carboxylic acid and 27.0g (46.4mmol) of (Z)-(2-aminothiazol-4-yl)-2-trityloxyiminoacetic acid 2-benzothiazolylthioester were mixed in 200ml of N,N-dimethyl-  
5 acetamide. 22.0ml (89.0mmol) of N,O-bis(trimethylsilyl)acetamide was added thereto and then the resulting mixture was stirred overnight at 10 to 20°C. After 600ml of diethylether and 10ml of methanol were added to the mixture, the whole mixture was stirred for 30 minutes and then  
10 filtered through a cellite. To the filtrate was added 12.6g (66.2mmol) of p-toluenesulfonic acid · monohydrate dissolved in 40ml of methanol and the resulting solution was stirred for 3 hours. After 400ml of diethylether was further added thereto, the solution was stirred for 2 hours and then filtered. The crystal thus obtained was washed  
15 sequentially with 60ml of N,N-dimethylacetamide-diethylether(1:5, v/v) and 100ml of diethylether and then dried to obtain 38.3g (Yield 88%) of 7-β-[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid · p-toluenesulfonic acid · 2 N,N-dimethylacetamide as a pale yellow crystal. The purity of the product determined by  
20 HPLC analysis was 99.4%, and melting point, IR and <sup>1</sup>H-NMR data were identical to those described in Example 1.

EXAMPLE 3

25 18.9g (32.5mmol) of diethylthiophosphoryl (Z)-(2-aminothiazol-4-yl)-2-trityloxyiminoacetate was dissolved in 105ml of N,N-dimethylacetamide. 7.0g (31mmol) of 7-amino-3-vinyl-3-cephem-4-carboxylic acid and 8.6ml (62mmol) of triethylamine were added thereto and then the resulting mixture was stirred for 2 hours at room temperature. 210ml of  
30 diethylether was added to the mixture, which was then stirred for 30 minutes and filtered through a cellite. To the filtrate was added 17.7g (93mmol) of p-toluenesulfonic acid · monohydrate dissolved in 25ml of ethanol and the resulting solution was stirred for one hour and a half. After 210ml of diethylether was further added thereto, the solution was  
35 filtered to obtain a crystal. The crystal thus obtained was washed

sequentially with 50ml of N,N-dimethylacetamide-diethylether(1:5, v/v) and 50ml of diethylether and then dried to obtain 26.2g (Yield 86%) of 7β-[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid · p-toluenesulfonic acid · 2 N,N-dimethylacetamide as a pale yellow crystal. The purity of the product determined by HPLC analysis was 98.5%, and melting point, IR and <sup>1</sup>H-NMR data were identical to those described in Example 1.

#### EXAMPLE 4

10.0g (44.0mmol) of 7-amino-3-vinyl-3-cephem-4-carboxylic acid and 27.0g (46.4mmol) of (Z)-(2-aminothiazol-4-yl)-2-trityloxyiminoacetic acid 2-benzothiazolylthioester were suspended in 150ml of N,N-dimethylacetamide. 21.0ml (88.0mmol) of tri-n-butylamine was added thereto and the mixture was stirred for 1 hour and a half at 15 to 25°C. 25.2g (133mmol) of p-toluenesulfonic acid · monohydrate was added to the mixture and thoroughly dissolved, 450ml of diisopropylether was added thereto and then the whole mixture was stirred for 2 hours. After 300ml of diisopropylether was added to the mixture, the resulting solution was stirred for 2 hours, cooled to about 5°C, stirred for 1 hour and filtered to obtain a crystal. The crystal thus obtained was washed sequentially with 50ml of N,N-dimethylacetamide-diethylether(1:5, v/v) and 50ml of diethylether and then dried to obtain 41.8g (Yield 96%) of 7β-[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid · p-toluenesulfonic acid · 2 N,N-dimethylacetamide as a pale yellow crystal. The purity of the product determined by HPLC analysis was 98.2%, and melting point, IR and <sup>1</sup>H-NMR data were identical to those described in Example 1.

#### EXAMPLE 5

10.0g (44.0mmol) of 7-amino-3-vinyl-3-cephem-4-carboxylic acid and 30.8g (53mmol) of (Z)-(2-aminothiazol-4-yl)-2-trityloxyiminoacetic acid 2-benzothiazolylthioester were mixed in 200ml of N,N-dimethylacetamide. 21.1ml (88mmol) of tri-n-butylamine was added thereto and

then the resulting mixture was stirred overnight at room temperature. After 400ml of diethylether and 2g of activated charcoal were added to the mixture, the whole mixture was stirred for 1 hour and then filtered through a cellite. To the filtrate was added 16.8g (88mmol) of  
5 p-toluenesulfonic acid · monohydrate dissolved in 30ml of methanol and the resulting solution was stirred for 2 hours. After 400ml of diethylether was further added thereto, the solution was stirred for 2 hours and then filtered. The crystal thus obtained was washed sequentially with 50ml of N,N-dimethylacetamide-diethylether(1:5, v/v)  
10 and 50ml of diethylether and then dried to obtain 37.0g (Yield 85%) of 7β-[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid · p-toluenesulfonic acid · 2 N,N-dimethylacetamide as a pale yellow crystal. The purity of the product determined by HPLC analysis was 98.5%, and melting point, IR and <sup>1</sup>H-NMR data were  
15 identical to those described in Example 1.

EXAMPLE 6: Synthesis of 7β-[2-(2-aminothiazol-4-yl)-2(Z)-(hydroxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid

20 15.0g (15.2mmol) of 7β-[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid · p-toluenesulfonic acid · 2 N,N-dimethylacetamide was dissolved in 90ml of methanol and then 0.51ml (15.2mmol) of 99% formic acid was added thereto. After the resulting mixture was stirred for 5 hours under reflux, the methanol  
25 contained therein was removed under reduced pressure and 50ml of water, 30ml of tetrahydrofuran and 60ml of ethylacetate were added to the residue. The pH of the solution was adjusted to 6.5 to 7.5 by adding sodium hydrogen carbonate little by little. The aqueous layer was separated, washed with a solvent mixture of 30ml of tetrahydrofuran and  
30 60ml of ethylacetate, and then adjusted to pH 2.4 to 2.8 using 2N-HCl. The crystal thus precipitated was stirred for 1 hour under ice-bath, filtered, washed with 30ml of water and dried to obtain 5.5g (Yield 92%) of the title compound as a pale yellow solid.

35 • HPLC Purity : 99.2%

- IR(KBr,  $\text{cm}^{-1}$ ) : 3300, 1780, 1665, 1180, 1130

### EXAMPLE 7

10.0g (10.2mmol) of 7 $\beta$ -[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxy-imino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid  $\cdot$  p-toluenesulfonic acid  $\cdot$  2 N,N-dimethylacetamide was dissolved in 20ml of methanol and then 20ml (0.26mol) of trifluoroacetic acid and 10ml (92mmol) of anisole were added thereto. After the mixture was stirred for 5 hours at 40 to 45°C, the methanol contained therein was removed under reduced pressure. The residue was dispersed in 200ml of ethylacetate, and then the resulting solution was stirred for 30 minutes and filtered. The pale yellow solid thus obtained was dried and dissolved in 60ml of water, 30ml of tetrahydrofuran and 60ml of ethylacetate. The pH of the solution was adjusted to 5.5 to 6.5 by adding sodium hydrogen carbonate little by little. The aqueous layer was separated, washed with a solvent mixture of 30ml of tetrahydrofuran and 60ml of ethylacetate, and then adjusted to pH 2.4 to 2.8 using 2N-HCl. The crystal thus precipitated was stirred for 1 hour under ice-bath, filtered, washed with 30ml of water and dried to obtain 3.6g (Yield 90%) of 7 $\beta$ -[2-(2-aminothiazol-4-yl)-2(Z)-(hydroxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid as a pale yellow solid. The purity of the product determined by HPLC analysis was 99.4%, and IR and  $^1\text{H}$ -NMR data were identical to those described in Example 6.

### EXAMPLE 8

To 5.0g (5.1mmol) of 7 $\beta$ -[2-(2-aminothiazol-4-yl)-2(Z)-(trityloxy-imino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid  $\cdot$  p-toluenesulfonic acid  $\cdot$  2 N,N-dimethylacetamide was added 15ml of 85% formic acid and the mixture was stirred for 2 hours at room temperature. After

tritylcarbinol thus precipitated was removed by filtration, the filtrate was concentrated under reduced pressure. To the residue were added 30ml of water, 10ml of tetrahydrofuran and 20ml of ethylacetate. The pH of the solution was adjusted to 6.5 by adding sodium hydrogen carbonate little by little. The aqueous layer was separated, washed with a solvent mixture of 10ml of tetrahydrofuran and 20ml of ethylacetate, and then adjusted to pH 2.4 to 2.8 using 2N-HCl. The crystal thus precipitated was stirred for 1 hour under ice-bath, filtered, washed with 10ml of water and dried to obtain 1.9g (Yield 93%) of 7 $\beta$ -[2-(2-aminothiazol-4-yl)-2(Z)-(hydroxyimino)acetamido]-3-vinyl-3-cephem-4-carboxylic acid as a pale yellow solid. The purity of the product determined by HPLC analysis was 99.1%, and IR and <sup>1</sup>H-NMR data were identical to those described in Example 6.

## WHAT IS CLAIMED IS :

1. A process for preparing cefdinir having the following formula (I),

- 10 characterized in that a trityl protecting group in a cefdinir intermediate having the following formula (II),

- 20 in which Ph represents phenyl, p-TsOH represents p-toluenesulfonic acid, and DMAC represents N,N-dimethylacetamide, is removed in the presence of an acid.

2. The process according to claim 1, wherein the acid is an inorganic acid, an organic acid, or an acidic hydrogen ion exchange resin.
- 25 3. The process according to claim 2, wherein the inorganic acid is selected from a group consisting of hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid and Lewis acid.
- 30 4. The process according to claim 3, wherein the Lewis acid is selected from a group consisting of boron trifluoride, boron trifluoride ethyletherate, aluminum chloride, antimony pentachloride, ferrous chloride, stannous chloride, titanium tetrachloride and zinc chloride.
- 35 5. The process according to claim 2, wherein the organic acid is selected from a group consisting of acetic acid, formic acid, trifluoroacetic

acid, methanesulfonic acid, benzenesulfonic acid and p-toluenesulfonic acid.

6. The process according to claim 2, wherein the reaction is carried out in the presence of a cation capturing agent when a Lewis acid or an organic acid is used.

7. The process according to claim 6, wherein the cation capturing agent is anisole.

8. The process according to claim 1, wherein the acid is used in an amount of 1 to 20 equivalents with respect to the compound of formula (II).

9. A crystalline cefdinir intermediate having the following formula (II) :

in which

Ph represents phenyl,

p-TsOH represents p-toluenesulfonic acid, and

25 DMAC represents N,N-dimethylacetamide

10. The intermediate of formula (II) according to claim 9, wherein it shows the X-ray powder diffraction pattern of the following Table 1.

30

35

Table 1.

|    | $\theta$ | d     | I / I <sub>0</sub> | $\theta$ | d    | I / I <sub>0</sub> |

In Table 1 above, " $\theta$ " represents a diffraction angle, "d" represents a spacing between the layers, and "I/I<sub>0</sub>" represents a relative intensity.

11. A process for preparing a compound having the following formula (II),

in which Ph represents phenyl, p-TsOH represents p-toluenesulfonic acid, and DMAC represents N,N-dimethylacetamide, characterized in that a reactive ester having the following formula (III),

20

or  $\text{—O—P}(=\text{S})(\text{OR}')_2$  wherein R' represents C<sub>1</sub>–C<sub>4</sub> alkyl or phenyl, or R' together with phosphorus and oxygen atoms to which R' is attached can form a 5 to 6-membered heterocycle, is reacted with a 3-cephem derivative having the following formula (IV),

25

in a solvent in the presence or absence of a base, and then p-toluenesulfonic acid is added thereto.

12. The process according to claim 11, wherein the reactive ester of formula (III) is used in an amount of 0.8 to 2.0 equivalents with respect to the 3-cephem derivative of formula (IV).
- 5 13. The process according to claim 11, wherein the solvent is N,N-dimethylacetamide alone, or a mixture of N,N-dimethylacetamide with one or more selected from a group consisting of ethanol, methanol, isopropanol, diethylether, tetrahydrofuran, dioxane, methylene chloride, chloroform, acetonitrile, ethylacetate and acetone.
- 10 14. The process according to claim 11, wherein the reaction is carried out at a temperature of -15 to 40°C.
- 15 15. The process according to claim 11, wherein a tertiary amine is used as the base.
16. The process according to claim 15, wherein the tertiary amine is triethylamine or tri-n-butylamine.
- 20 17. The process according to claim 11, wherein N-trimethylsilyl-acetamide or N,O-bis(trimethylsilyl)acetamide is used in the absence of a base.
- 25 18. The process according to claim 11, wherein p-toluenesulfonic acid is used in an amount of 1 to 3 equivalents with respect to the 3-cephem derivative of formula (IV).
- 30 19. The process according to claim 11, wherein one selected from a group consisting of diethylether, diisopropylether and ethylacetate is used in an amount of 2 to 6 times by volume with respect to the reaction solvent in the work-up procedure.

## INTERNATIONAL SEARCH REPORT

WO 95/35 020 A1

There are disclosed new compounds of formula (I), wherein R is: a hydrogen atom, a linear or branched C1-C4 alkyl group, unsubstituted or substituted by at least a phenyl group or at least a hydrogen atom, a benzyl group substituted by at least a linear or branched C1-C4 alkyl or alkoxy group or a nitro group, a silyl substituted by at least a linear or branched, unsubstituted or substituted C1-C4 alkyl group.

Chemical Abstracts 61761t

The synthesis, antibacterial activity and oral absorption of the 7 $\beta$ -[(Z)-2-aryl-2-hydroxy=iminoacetamidol]-3-vinylcephalosporins are described. All of these compounds exhibited excellent activity against *Staphylococcus aureus*. Against Gram-negative bacteria FK482 exhibited better activity than the first called compound. The relationship between the oral absorption rates and the lipophilicity of these cephalosporins was discussed.

Chemical Abstracts 142931a

The synthesis of 7 $\beta$ -[(Z)-2-(aminothiazol-4-yl)-2-hydroxyiminoacetamido]-cephalosporins modified at the C-3 position of a cephem nucleus and the effect of the C-3 substituents on the antibacterial activity and oral absorbability are discussed. The cepheims having a C-3 substituent such as 1-propenyl, ethylthio and vinylthio group as well as cefdinir exhibited excellent antibacterial activities against both Gram-positive and Gram-negative bacteria. However, those compounds showed poor absorption rate after oral administration in rats. It is concluded that the vinyl moiety at the 3-position is necessary to display fairly oral absorptivity in a series of such cepheims.
